Abstract

Background: The paper aims to provide an integrative review of empirical literature on factors affecting knowledge sharing in supply chain, analyzing the various results of the published articles about the topic to find out critical factors.

Method: A quality-quantitative mixed method has been adopted in our exploratory study. Delphi method, a qualitative approach, has been initially applied to design a conceptual model for knowledge sharing within supply chain. After this, through a review of literature, 21 articles have been analyzed based on the resulted model to present the critical factors. Finally, the resulting model has been examined and evaluated in the case study, by a quantitative approach. The main instrument of the study is a researcher-made questionnaire. The statistical population comprises all the managers of Khorasan Electricity Supply Chain in Iran (461 people). 215 of them have been selected as samples, using Stratified Random Sampling. Data analyzed by using SPSS 21 software, Z-test, Friedman test, and Student's t-test.

Results: According to the results, a model for knowledge sharing in supply chain has been developed based on 5 dimensions and 38 factors. In addition, Communication, trust, and absorptive capacity of knowledge receiver are primary factors in a majority of articles. Also, inter-organizational trust is at average level in Khorasan Electricity Supply Chain, Iran.

Conclusion: This paper will contribute to improve understanding on the role of trust as one of the most important components of professional ethics in promoting the culture of knowledge sharing among members.

Introduction

Competition between supply chains is fast replacing competition between and among firms, thanks to the maximum value that the supply chains make available for the customers. Supply chain is a set of firms that pass materials forward (1). There are typically three flows in the supply chain: materials, information, and financial (2). Supply chain practice focuses on material movement while information sharing focuses on information flow. Information sharing is a prerequisite for knowledge sharing (3). Since 2003, the research on knowledge sharing in supply chain has attracted the attention of scholars at both national and international level. In a research, the factors affecting trading partners' knowledge sharing were studied using the lens of transaction cost economics and socio-political theories. The findings showed that trust towards the partner, the partner's power, and magnitude of interdependence are the factors that affect the firm's decision-making on knowledge sharing with a particular trading partner (4). In another research, it was examined how trust interacts with factors affecting inter-organizational knowledge sharing in Taiwan's green supply chain, where cooperation and competition coexist. The influencing factors on inter-organizational knowledge sharing were identified, including participation, communication, opportunistic behavior, power, resource fitness, and learning capacity (5). Some researchers aimed at analyzing the published journals and combine various results to find out critical factors affecting knowledge sharing. Their research concludes that trust, pro-sharing norms, identification, and reciprocity are primary factors in a majority of articles (6). In a study, the influencing factors on knowledge sharing were discussed from five aspects including knowledge-sharing platform, enterprise organizational structure, corporate culture, Trust among enterprises, and knowledge market in supply chain (7). Some researchers investigated the influencing factors on knowledge sharing in supply chain from the perspective of knowledge characteristics. The results

showed that the knowledge tacitness, knowledge complexity, and knowledge embeddedness reduce the behavior and effects of knowledge sharing among supply chain members (8). Other researchers studied knowledge sharing among enterprises in the supply chain. Knowledge sharing cost, knowledge sharing environment, the infrastructure of information technology, the learning capacity, and cultural factors are considered to be the factors that affect the knowledge sharing and knowledge transfer among enterprises in supply chain (9). Some researchers identified the influencing factors on inter-organizational trust and knowledge sharing in supply chain including shared goals, social relational embeddedness, and influence strategy (10). Other authors ranked the factors affecting information sharing in the supply chain of NIORDC using fuzzy multi-criteria decision making technique. Based on the research's results, accountability and commitment among supply chain members, senior management support, the accuracy rate of the provided information, the level of the available information technology capability among the members of the supply chain, the cost of the required information technology, the lack of customer reliability, and the interests of the supply chain members were respectively identified as the most important factors affecting the information sharing in the supply chain of NIORDC (11). The result of a research showed that the principles of professional ethics and managing intellectual capital at universities can be of great importance in promoting the culture of knowledge sharing and also effective training among faculty members (12). As a matter of fact, assuring the effectiveness of knowledge sharing in supply chain may be a source of competitive advantage. This is the reason why providing a systematic study of the factors influencing the share of knowledge in supply chain covers a high significance as well as few studies have summarized and analyzed the various results of the published articles about factors affecting knowledge sharing in supply chain.

Therefore, this study is going to provide an integrative review of empirical literature on factors affecting knowledge sharing in supply chain.

Materials & Methods

Delphi method, a qualitative approach, was initially applied to design a conceptual model for knowledge sharing within supply chain. Delphi technique is well suited as a mean and method for consensus-building by using a series of questionnaires to collect data from a panel of selected subjects (13). The selection of the qualified members for Delphi group is considered the most important stage of this method because the validity of the results depends on the competence and knowledge of these people. The selection of group members is usually done through Non-probability sampling. Non-probability sampling is often divided into three primary categories: quota sampling, purposive sampling, and convenience sampling. Purposive sampling is also referred to as judgmental sampling or expert sampling. The main objective of purposive sampling is to produce a sample that can be considered "representative" of the population (14). Accordingly, in order to form the Delphi panel in this research, 132 people (85 in abroad and 47 in Iran) have been identified using the purposive sampling and finally, among invited experts in Delphi panel, 23 people announced their agreement and formed the expert panel of the research.

The development stage of Delphi, for this research, has been organized into three phases as follows: in the first phase, an unstructured or open questionnaire has been provided to the expert panel to identify all factors influencing knowledge sharing in the supply chain. After gathering and organizing responses, finally, 110 factors have been identified, in order to be used to design the structured questionnaire (as the instrument of the next phase). In the second phase, members of expert panel have been asked for their comments and views on the 110 factors in a five points "Likert" scale range. At this stage, with the aim of re-evaluation of the importance and effect of the factors agreed in the initial Del-

phi plan, the significance of each factor has been measured by a statistical Z-test and proportion of supporters and opposes for each of the factors have been obtained. Based on the results of this stage, 63 factors have been approved by the Delphi panel members and 47 rejected factors have been removed from the final model of factors influencing knowledge sharing in the supply chain. Also in this stage, the Delphi panel members have been asked to classify the factors discussed in the suggested dimensions. According to the results, the meaningful factors in this stage (63 factors) have been classified into five categories of the dimensions include: inter-organizational, organizational, environmental, cultural and knowledge. In the final phase, Delphi panel have been, once again, asked to comment their views in relation to each of 63 factors formatted in the five dimensions to identify the "agreement" and "disagreement" Items. Also, indicators for the remaining factors have been determined in this stage. Thus, Delphi technique ended after the third round and the factors affecting Knowledge sharing in the supply chain in 5 dimensions and 38 factors and 126 indexes have been confirmed.

Next, through a review of literature on knowledge sharing in supply chain, 21 articles have been found, published between 2003 and 2015, which examined the factors affecting knowledge sharing in supply chain. Sometimes knowledge sharing called as knowledge transfer (15), so knowledge transfer (KT) should not be ignored to explore knowledge sharing. For example, Riege identifies over three dozen knowledge-sharing barriers in one article in 2005. In a more recent article in 2007, the same author uses the term knowledge transfer when suggesting actions to overcome the same and similar barriers (16). Therefore, the papers were chosen by searching their abstracts for either keywords "knowledge sharing," "knowledge transfer," or "information sharing." After this, an analysis was applied to summarize and analyze 21 articles based on the framework mentioned above.

Finally, the resulting model has been examined and evaluated in Khorasan Electricity Supply Chain, Iran. The main instrument of this research is a researcher-

made questionnaire that its validity was achieved through Content. Also, Cronbach's alpha test has been used to assess reliability of the questionnaire, which according to the alpha obtained at 97 %, it could be concluded that the questionnaire's reliability (trustworthy) is acceptable. The statistical population of the research comprises all the managers of Khorasan Electricity Supply Chain in Iran, employed in the fields of generation, transmission, and distribution (461 people). 215 of them have been selected as samples, using Stratified Random Sampling. Data analyzed by using SPSS 21 software and statistical tests (Z-test, Friedman test, and Student's t-test).

Results

The Research model

Based on the results, an appropriate model for knowledge sharing in supply chain was determined in 5 dimensions and 38 factors. Fig. 1 shows the research model.

An Analysis of Empirical Findings/ Distribution of Articles by Year

The distribution of articles published by year is shown in Table 1. Since 2003, the research on

knowledge sharing in supply chain is gradually increasing.

Distribution of Articles by Factors Affecting Knowledge Sharing

Based on the research model, the study summarized five dimensions and adopted an analysis to understand the distribution in relevant literature. Distribution of articles by factors affecting knowledge sharing is shown in Table 2. 8 papers (38%) indicated that Communication was a significant factor affecting Knowledge Sharing in supply chain. Trust among enterprises in supply chain had the second largest percentage (7 articles, 33%) of the articles. Absorptive capacity of knowledge receiver with 6 (29%) articles was located in third rank. Integrated technical infrastructure, knowledge sharing cost, and Participation were located in fourth rank with 4 (19%) articles. Complexity and diversity of the supply chain knowledge, and Shared values were located in next rank with 3 (14%) articles. The other factors were at the least rank with only 0(0%) or 1 (5%) or 2 (10%) articles. The 8 factors are discussed by ranking as follows.

Table 1: Distribution of articles by year

Publication Year	Number of Articles
2003	2
2005	1
2006	1
2007	1
2008	2
2009	3
2010	4
2011	1
2012	4
2014	1
2015	1

To Test Model in a Case Study

Based on the research's results (arising by the testing and validation of the model), Cultural dimension is located in third rank in Khorasan Electricity Supply Chain, whereas this dimension was identified as the most important dimension

influencing knowledge sharing in the supply chain from the experts' point of view (Refer Table 3). Also, the results showed that the trust among enterprises in supply chain is lower than the other factors of cultural dimension (Refer Table 4).

Table 3: Friedman test to determine priority of the five dimensions from the experts' point of view

Category	Mean Rank
Cultural dimension	4.20
Inter-organizational dimension	3.43
Organizational dimension	3.25
Knowledge dimension	3.02
Environmental dimension	2.95
$\chi^2 = 14.253$, DF = 4, Sig. = 0.007	

Table 4: Student's t -Test to evaluate the factors related to culture dimension from the managers' point of view

Factor	M	σ	T	P-value
Participation	66.6	19.7	12.31	0.000
Trust among enterprises in supply chain	51.9	15.7	1.76	0.040
Shared values	64.2	16.4	12.65	0.000

Discussion

This paper concludes that communication, trust among enterprises in supply chain, and absorptive capacity of knowledge receiver are primary factors in a majority of articles. The research focus is on the trust, as one of the most important components of professional ethics (17). Professional ethics is a code of values and norms that actually guide practical decisions when they are made by professionals (18). The employees' professional ethic can increase their participation rate in the knowledge and sharing of knowledge and experiences (19). Trust among enterprises in supply chain refers to a firm's belief to have confidence in its partner's reliability and integrity that lead to positive outcomes (5). Also, it is defined as a belief that one organization acts in a consistent manner and will perform in accordance with expectations and intentions (20). According

to the results, since trust among enterprises in Khorasan Electricity Supply Chain is at average level, it is necessary to establish an open corporate culture which encourages knowledge innovation and knowledge sharing and makes all members be aware that the benefits of knowledge sharing is greater (21).

To strengthen the trust and communication of member enterprises in supply chain, some steps must be taken including enhancing the transparency of knowledge sharing through formal or informal channels of communication among member enterprises, and then evaluating the credibility level of the knowledge sharing, establishing and improving the incentive mechanism to stimulate the enthusiasm of member enterprises, correcting the opportunistic behaviors of knowledge sharing (7). The research results are consistent with various studies (i.e., 4, 5, 6, 8, 9, 10, 22, 23, and 24). This study is conducted on

supply chains, with data collected from Khorasan Electricity Supply Chain in Iran. The extent to which the findings can be generalized to others is unknown.

Conclusions

This research will contribute to develop a conceptual model useful for future investigations, providing an integrative review of empirical literature on factors affecting knowledge sharing in supply chain, and achieving more comprehensive understanding about the role of professional ethics components as a competitive advantage in enhancing the culture of inter-organizational knowledge sharing in supply chains.

Ethical consideration

Ethical issues (Including plagiarism, informed consent, misconduct, data fabrication and/or falsification, double publication and/or submission, redundancy, etc.) have been completely observed by the authors.
